

Test Bank - Chapter 01

Q1: A graduate nurse has been hired as a nurse at a local hospital. The new nurse is in the honeymoon phase of role transition when making which of the following statements?

- A. "I am so nervous about being on my own as a nurse."
- B. "This will be a great learning experience."
- C. "I can't wait to have a steady paycheck."
- D. "This job is perfect. I can finally do things my own way." (Correct)**

Rationale: The honeymoon phase is when the student nurse sees the world of nursing as quite rosy. Often, the new graduate is fascinated with the thrill of arriving in the profession. Reality shock occurs when one moves into the workforce after several years of educational preparation. Recovery and resolution occur when the graduate nurse is able to laugh at encountered situations. During this time, tension decreases, perception increases, and the nurse is able to grow as a person.

Q2: Which of the following actions by the graduate nurse is an inappropriate methodology to recover from transition shock?

- A. Networking
- B. Obtaining a mentor
- C. Returning to school (Correct)**
- D. Joining a support group

Rationale: The transition period is successfully managed when the graduate is able to evaluate the work situation objectively and effectively predict the actions and reactions of other staff. Nurturing the ability to see the humor in a situation may be a first step. Returning to school is a positive step after the graduate has worked through role transition, has some clinical experience, and is ready to focus on a new career objective. Networking, obtaining a mentor, and joining a support group would give the graduate nurse an opportunity to talk to others experiencing the stress associated with reality shock. The nurse would benefit from "talking through" issues and learning how to cope.

Q3: A new nurse who has been off orientation for 4 months now is trying to avoid burnout. Which of the following actions is a valid way to achieve this?

- A. Refusing to constantly work extra shifts (Correct)**
- B. Withdrawing from peer support group
- C. "Going native"
- D. Changing jobs every 6 to 12 months

Rationale: At this phase of the nurse's career, he or she is in the Doing Stage of Transition. One common characteristic of this phase is the inability to set reasonable boundaries related to work. Constantly working overtime will lead the new nurse to burnout. "Going native" is the term that describes how recent graduates begin to copy and identify the reality of their role-transition experience by rejecting the values from nursing school and functioning more like a team member at their place of employment. Withdrawing from peer support groups, "going native," and changing

jobs every 6 to 12 months would increase the chance of the nurse experiencing burnout. The nurse should instead focus on his/her practice and seek out support from other nurses.

Q4: Which of the following statements by the graduate nurse shows an understanding of reality shock as it applies to nursing?

A. "Reality shock is the period when a person moves from school into the workforce." (Correct)

B. "Reality shock is the realization that practice and education are not the same."

C. "Reality shock is the period from graduation to becoming an experienced nurse."

D. "Reality shock is a transition phase that new graduates go through before changing jobs."

Rationale: "Reality shock" is a term often used to describe the reaction experienced when one moves into the workforce after several years of educational preparation. The new graduate is caught in the situation of moving from a familiar, comfortable educational environment into a new role in the workforce where the expectations are not clearly defined or may not even be realistic. The realization that practice and nursing school are not the same is often associated with "going native." When nurses move from one position to another, they have already experienced reality shock. Becoming an experienced nurse takes time and is not part of the definition of reality shock.

Q5: A student in the last semester of nursing school has established a goal of making a successful role transition to graduate nurse. Which statement by the student indicates their understanding of how to achieve this goal?

A. "I should care for increased number of patients to enhance work organization skills." (Correct)

B. "I will observe staff nurses as they perform nursing procedures to refine technique."

C. "I should seek increasingly close guidance from the nursing instructor to reduce errors."

D. "I will evaluate my progress every 7 weeks or more to allow time for growth."

Rationale: It is important for the student to start taking care of increased number of patients to help with time management and work organization. The student should also be able to function without close guidance from the nursing instructor. Although it is good for students to observe staff, a student in the final semester should be able to perform tasks with minimal observation and should instead focus on implementing care and time management. Waiting 7 weeks to evaluate progress would not be helpful to the student. Although regular self-evaluation is an important process, it is the actual experience of taking realistic patient assignments and working typical shift hours that assists with successful role transition.

Q6: A new graduate of less than 1 year describes their perception of a staff nurse position, stating, "It feels great to be a nurse! In fact, it's a snap! I can hardly believe there's no instructor looking over my shoulder." What phase of reality shock is the graduate experiencing?

A. Recovery

B. Shock and rejection

C. Honeymoon (Correct)

D. Transition

Rationale: In the first phase of the role transition process (the honeymoon phase), the graduate nurse is thrilled with completing school and accepting the first job. Life is a bed of roses because everyone knows nursing school is much harder than nursing practice. Shock and rejection occur as the nurse tries to understand how nursing school and the “real world” come together. A transition occurs as the nurse begins the move from student to nurse and refers to the entire process, not just a particular phase. The recovery phase is when the nurse can laugh at situations that he/she is in and is able to cope with the situations that are being faced.

Q7: A new graduate has worked in a busy unit for 6 months since graduating from nursing school. The graduate tells a friend, “I’ve never been so upset in all my life! The care that some of the staff give our patients is outrageously bad. There’s practically no attention to the principles of asepsis the way I learned them! The staff tell me that we have to cut corners if we’re going to get all the work done. I can’t stand it!” What phase of reality shock is this graduate experiencing?

- A. Honeymoon
- B. Shock and rejection (Correct)**
- C. Recovery
- D. Role transformation

Rationale: The honeymoon phase for the new graduate nurse is short lived when the graduate identifies the conflicts between the way he/she was taught and the reality of what is done. Shock and rejection cause mental and emotional withdrawal, moral outrage, and a hypercritical attitude, which are just some of the symptoms of the realization that the honeymoon is over. Excessive mistrust, frequent pains and illness, a decrease in energy and fatigue, feeling like a failure and blaming oneself for every mistake, a hypercritical attitude, and feeling morally outraged are the characteristics of the shock and rejection phase. The recovery phase is characterized by a beginning sense of humor (usually the first sigh), a decrease in tension, and an increase in the ability to cope with the situations that he/she is faced with. Role transformation is the process of transforming from a student to nurse.

Q8: A graduate nurse has been out of school for 3 months and working in a staff nurse position for the past 2 months. What type of transition is the nurse experiencing?

- A. A developmental transition
- B. An organizational transition
- C. A health-oriented transition
- D. A situational transition (Correct)**

Rationale: A situational transition is a lifestyle change that occurs because of a new situation. Most often the changes are by choice—for instance, graduations, marriages, and new jobs. Developmental transitions include becoming a parent or going through a midlife crisis. An organizational transition involves a change in leadership. A health-oriented transition involves dealing with an illness or health issue, such as coping with a chronic illness.

Q9: The graduate nurse understands that transitions occur throughout life. What action does the nurse identify as influential in a successful transition from school to practice?

- A. Acquiring new knowledge and skills required in the new environment (Correct)**

- B. Completing classwork required to obtain an advanced degree
- C. Reflecting on personal history of previous developmental transitions
- D. Discuss transitional experiences with other classmates

Rationale: The transition from student to practice reflects a situational transition that is most often affected by the anticipation of changes in the new work environment. Classwork no longer affects this transition. A personal history of previous developmental transitions and the influence of classmates are not as prominent as the anticipated requirements to function in the new environment of work.

Q10: A nurse manager giving a presentation at a local community college demonstrates an awareness of the job expectations of a new graduate when making which of the following statements?

- A. "A newly graduated nurse should be able to perform as independently as was demonstrated the last semester of nursing."
- B. "A newly graduated nurse should be able to function competently as a registered nurse at the entry level." (Correct)**
- C. "A newly graduated nurse should be able to function in the role that was described in the curriculum for the school of nursing."
- D. "A newly graduated nurse should be able to be able to function independently with the ability to make clinical nursing judgments."

Rationale: A newly graduated nurse is expected to be competent and capable. Hospitals frequently provide an extended orientation to assist the new graduate to transition into the independent role of the nurse. The new graduate nurse is not expected to function independently with the ability to make clinical nursing judgments. School curriculum and how one functioned the last semester of school are usually not considered in the job expectations of a new graduate.

Q11: Which action by the graduate nurse shows that a successful transition to nursing has been made?

- A. The nurse begins to work with the nursing team and functions as others expect.
- B. The nurse begins to objectively evaluate work experiences and enjoy the humor of clinical situations. (Correct)**
- C. The nurse believes everything is great, patients are wonderful, and the new unit is so nice.
- D. The nurse meets regularly with other new graduates to compare and discuss problems.

Rationale: Objectivity and humor are two of the characteristics of a successful transition. "Going native" occurs when the graduate begins to provide care in the manner that the team or group wants it done, not necessarily the correct way. The "honeymoon phase" is when everything is going great. Meeting with other new graduates can be productive, but it is a part of the transition and not an indication of a successful transition.

Q12: A student nurse is in the last semester of nursing school. Which action by the nursing student indicates appropriate preparation for the transition experience?

A. The nursing student requests additional experiences in performing skills and procedures. (Correct)

B. The nursing student maintains close contact with a nursing instructor to observe nursing procedures.

C. The nursing student practices nursing assessments and care on one or two patients to become more competent.

D. The nursing student increases communication with a nursing instructor to maintain a resource person after graduation.

Rationale: Students should get all the experience, not just observation, possible before graduation. They should request opportunities to perform procedures and skills and request feedback from staff nurses and instructors. Students should also begin to build resources that will be available after graduation. It is during the last semester that students begin to care for more complex patients (and more patient numbers) to gain experience in the “real world” of nursing management and to have less reliance on the nursing instructor as a resource person.

Q13: A nurse manager demonstrates an understanding of the NCSBN's opinion on clinical judgment when making which of the following statements?

A. “The intention of clinical judgment is to provide standardization in nursing care.”

B. “Clinical judgement requires that the new graduate work with a preceptor.”

C. “It is the outcome of critical thinking and decision-making using nursing knowledge.” (Correct)

D. “Evidence-based nursing interventions are not always associated with clinical judgement.”

Rationale: The NCSBN's view regarding clinical judgment is that it is the observed outcome of critical thinking and decision making. It is an iterative process that uses nursing knowledge to observe and assess presenting situations, identify a prioritized client concern, and generate the best possible evidence-based solutions to deliver safe client care. None of the remaining options reflect the NCSBN's opinion's opinion regarding clinical judgement.

Q14: The nurse demonstrates an understanding of transitions when making which statement about situational transitions?

A. “This type of transition can occur when a new nurse manager is hired.”

B. “This type of transition occurs only when with a person is diagnosed with a chronic illness.”

C. “I experienced this type of transition when I became a pediatric nurse practitioner.” (Correct)

D. “I've seen this type of transition occurs when nurses reach their 50's.”

Rationale: A situational transition occurs with the change from one situation to another, such as a career change. Dealing with a chronic illness would be characteristic of a health–illness transition, a leadership change would be an organizational transition, and a midlife crisis would be a developmental transition.

Q15: A student in the last semester of a nursing school wants to be sure of adequate preparation for the transition experience. Which patient should be added to the clinical assignment to assist in

this process?

A. A 48-year-old man with heart failure who has oral and IV medications due and needs a new IV started (Correct)

B. A 38-year-old woman who cares for themselves independently and is going home later today

C. A 25-year-old man who is leaving the hospital against medical advice

D. A 40-year-old man who needs education on diabetes management

Rationale: To adequately prepare for role transition, the student nurse needs realistic assignments and real-life experiences. It would be most appropriate for the student to accept the most complex patient, who requires oral and IV medications and needs to have his IV restarted. The patient who can care for herself independently and the one who is leaving the hospital against medical advice would not provide as much skill experience. Diabetic teaching is important but does not require the time management and work organization skills of a complex patient.

Q16: A student nurse is interested in improving nursing skills. What action would be the best for the student nurse to take?

A. Ask the instructor for extra skills practice during clinical hours. (Correct)

B. Watch videos on how to perform the nursing skills that need practice.

C. Review current nursing textbooks.

D. Observe nurses perform skills in the clinical setting.

Rationale: The best way for the nursing student to improve skills is to get hands-on practice. The student would benefit most from requesting extra skills practice during clinical hours, where skills can be performed on real patients, with the guidance of a clinical instructor. Therefore, watching skills videos, reviewing nursing textbooks, and observing other nurses would not help the student obtain hands-on practice.

Q17: A nursing student is nearing the end of their clinical experience. The student would like to care for patients who are typically challenging for students in the first year of practice. Which patient would be the best choice for this student?

A. A 62-year-old man with diabetes who needs outpatient care set up

B. A 30-year-old woman with a kidney stone requiring IV pain medications

C. A 45-year-old man with chest tubes recovering from a car crash (Correct)

D. A 25-year-old woman who received blood yesterday

Rationale: The skills that nursing students have identified as the most challenging include code blues, chest tubes, intravenous skills, central lines, blood administration, and patient-controlled analgesia. The most appropriate patient for the student to increase his/her skill level would be the 45-year-old man with chest tubes. The other patients are not considered to be "challenging patients" for most nursing students.

Q18: Which statement by the nursing student indicates an understanding of the importance of constructive feedback?

A. "I will wait until my clinical evaluation and then make any changes to my practice that are needed."

B. "I will request routine feedback from my instructor so I can make any changes needed to improve my skills." (Correct)

C. "My instructor will let me know if I need to change anything."

D. "I will ask my colleagues if I need to make any changes to my practice."

Rationale: Students are responsible for their skills and growth as health care providers. To ensure that their nursing skills are adequate, students should request periodic feedback from their clinical instructors. Waiting for feedback or asking colleagues would not be an effective way for nursing students to obtain feedback in a timely manner.

Q19: A graduate nurse has clocked in for their second shift on a busy orthopedic unit. After accepting the assignment, the graduate nurse notices a fellow nurse complaining loudly at the nurse's station to other staff members. This fellow nurse is typically upset with floor assignments and thinks that the "new nurses get all the easy assignments." Which action would be best for the graduate nurse to take?

A. Join the conversation and tell the fellow nurse that he/she does not care for the assignment either.

B. Begin a conversation with another staff member about the fellow nurse who is complaining.

C. Steer clear of the nurse who is complaining and try to focus on the positive. (Correct)

D. Begin complaining about his/her own assignment.

Rationale: The graduate nurse would have the most success by steering clear of the complaining nurse and focusing on the positive. Joining the conversation and focusing on the negative will not help the graduate nurse adjust to his/her new job.

Q20: A new nurse is caring for five patients on a busy surgical floor. While hanging blood for a patient, the nurse receives notice that another assigned patient is being taken for surgery. The nurse has not obtained informed consent from the patient. What action should the new nurse take?

A. Immediately leave the room they are in and obtain informed consent from the patient.

B. Allow the patient to go to surgery without obtaining informed consent.

C. Delegate obtaining informed consent to another nurse while staying with the patient who is receiving blood. (Correct)

D. Ask the transporter to obtain informed consent from the patient.

Rationale: Although the nurse must stay with the patient while hanging blood, it is important that informed consent be obtained from the other patient before going to surgery. The best action for the nurse to take would be to compromise and delegate obtaining informed consent to another nurse. The other actions would be inappropriate and possibly dangerous to the patients involved.

Q21: The new graduate has an understanding of the nursing journey ahead when making what statement?

A. "It is not acceptable for me to make any mistakes at all."

B. "I am not worried about issues with transition. I am tough. I will do just fine!"

C. “I know that I will make some mistakes, but I will learn and grow from them.”

(Correct)

D. “I am going to keep studying so that I am always right.”

Rationale: It is important for graduate nurses to know that they will make mistakes in their nursing careers and that they learn and grow from them. It is not realistic for graduate nurses to believe that they will not make any mistakes or will not struggle with transition.

Q22: A nurse has worked the past 5 days in a row to make some extra money. Today is a scheduled day off. Which of the following actions would be the best for this nurse to take?

A. Call the unit to see if they need the nurse to work.

B. Read nursing articles and take practice quizzes to stay up-to-date.

C. Take their small children to the zoo. (Correct)

D. Work on a continuing education requirement.

Rationale: It is important that the nurse take time to relax and have fun. Taking his/her small children to the zoo is a non-work-related activity that would ease stress and be enjoyable.

Q23: A nurse manager is preparing a group of newly hired nurses to work on the unit. After educating them on reality shock, a student asks what physical and psychological symptoms the nurse may experience? The nurse manager makes replies? (Select all that apply.) (Select all that apply.)

A. “All the symptoms are psychological in nature.”

B. “You may experience headaches.” (Correct)

C. “Gastrointestinal upset is possible.” (Correct)

D. “You could experience insomnia.” (Correct)

E. “Women may experience menorrhagia.”

Rationale: Reality shock can cause physical and psychological symptoms that are important for the nurse to be aware of. These can include headache, insomnia, feeling stressed out, gastrointestinal upset, and post-student blues. Menorrhagia (excessive menstrual bleeding) is not a typical physical symptom of reality shock.

Q24: A new nurse wants to make personal lifestyle changes to become a healthier individual. Which actions would help with reaching this goal? (Select all that apply.) (Select all that apply.)

A. Begin an exercise routine. (Correct)

B. Eat protein snacks late at night.

C. Incorporate relaxation into his/her schedule. (Correct)

D. Begin eating nutritious meals and snacks. (Correct)

E. Be sure to get adequate sleep. (Correct)

Rationale: To maintain health and wellness, the new nurse should begin an exercise routine, incorporate relaxation into his/her schedule, begin eating adequate nutritious meals and snacks, and get adequate sleep. The nurse should consider cutting out snacks late at night.

Q25: Which action would greatly help the graduate nurse when seeking out employment? (Select all that apply.) *(Select all that apply.)*

- A. Plan out interviews. (Correct)**
- B. Ask to speak to nurses who work on the unit. (Correct)**
- C. Wait until the interview to gather all of the information.
- D. Find out what type of nursing care is delivered. (Correct)**
- E. Determine the length of orientation. (Correct)**

Rationale: It is important for the graduate nurse to be prepared when seeking out employment. Planning out interviews, speaking to nurses who work on the units, finding out what type of nursing care is provided, and determining the length of orientation are all actions the graduate nurse can take to prepare for employment. Waiting to gather information at the interview can leave the graduate nurse feeling frazzled and disorganized.

Review Questions - Chapter 01

Q1: A nursing manager has just hired several new graduates on an inpatient unit. Having heard of the “honeymoon phase” of transitioning into nursing, which action by the manager would be the most helpful?

- A. Educate the graduates on phases of reality shock. (Correct)**
- B. Help the graduates concentrate on principles of safe care.
- C. Offer social events for new and seasoned nursing staff.
- D. Remind the graduates that they should keep their positive attitudes.

Rationale: Graduate nurses typically go through several phases during their transition to professional nursing. In the honeymoon phase, they are excited and positive about beginning their careers. However, this excitement is short-lived as they begin to see the conflicts between the realities of the workplace and what they were taught. The manager can best help by educating the graduates about the phases of reality shock, so they are not surprised. Helping graduates concentrate on principles of safe care will not help the new nurses negotiate their way through the honeymoon phase. Offering social events for nursing staff might be helpful in promoting socialization within the unit but will not be as helpful as preparing the new nurses for what to expect. Reminding the graduates to keep positive attitudes does not give the new nurses the knowledge or tools to deal with this situation.

Q2: A nurse with an experience of 15 years has been working in the intensive care unit (ICU) for 2 months. The nurse’s preceptor is expressing frustration to the unit manager because the new nurse follows all the rules “to the letter” and is inflexible. Which action by the manager is most helpful?

- A. Encourage the preceptor to be patient and give the new nurse easier assignments.
- B. Explain that as a nurse new to the ICU setting, this rule-bound practice is expected. (Correct)**
- C. Discuss the situation with the new nurse and emphasize the nurse’s years of experience.
- D. Mediate a conversation with the nurses where performance expectations are reviewed.

Rationale: Being inflexible and practicing according to rules instead of applying concepts to patient situations are characteristic of a novice nurse. Although this nurse has several years of experience, the ICU is a new practice environment, which can lead to the nurse reverting back to the novice stage. The manager needs to explain this process to the preceptor, who can then use this knowledge to provide the best mentoring possible. The nurse should not just be given easier assignments. This will not help him or her grow in professional abilities and become an expert practitioner. Although the nurse has years of experience, emphasizing this fact and expecting a performance that matches the previous job’s performance does not take into account that this is a normal transition and may possibly make the nurse feel like he or she is not doing a good job. Reviewing performance expectations may need to occur, but not until after the preceptor has been given the tools to maximize the new nurse’s experience and promote growth.

Q3: A nurse is preparing to give a performance review to a new graduate who has worked on the unit for 1 year. Which action by the nurse leads the manager to conclude that a successful professional transition is occurring for the new nurse?

- A. Is easy to work with and is cooperative.
- B. Has not called in sick or been late during the entire time of employment.
- C. Picks up extra shifts and frequently works overtime to care for “my patients.”
- D. Able to adjust to workload without compromising safety or quality care. (Correct)**

Rationale: The transition to professional practice is often marred by reality shock. During the shock and resentment phase, new nurses often abandon the values and practices they learned in school and take shortcuts to cope with heavy workloads and because “everyone else does it.” The nurse who can adjust to changing workloads while upholding patient safety and quality care has made the transition without resorting to withdrawal from professional standards. Being easy to work with and cooperative also does not indicate a successful transition; this nurse may feel powerless to do anything but comply with expectations. Although sometimes nurses in the shock and resentment phase do become preoccupied with minor ailments, not calling in sick does not demonstrate a successful transition. Working extra to care for “my patients” may indicate distrust of coworkers.

Q4: A nurse manager is teaching a seminar for managers on reality shock experienced by new graduates. What information does the nurse’s manager provide? (Select all that apply.) (Select all that apply.)

- A. Honeymoon phase: nurses seem energetic and fascinated with nursing. (Correct)**
- B. Shock and rejection phase: nurses blame everyone else for any mistakes.
- C. Shock and rejection phase: nurses may become hypercritical toward nursing. (Correct)**
- D. Recovery phase: nurses use humor to cope with work. (Correct)**
- E. Recovery phase: nurses view situations objectively. (Correct)**

Rationale: In the honeymoon phase, new nurses appear fascinated with having “arrived” in the profession are energetic and have a very positive outlook on nursing. During the shock and rejection phase, new nurses experience mistrust, may become hypercritical toward nursing, have a decreased energy level and fatigue, feel like failures as they blame themselves for every mistake, tend to band together with those who share similar values, are hypercritical, and feel moral outrage that the real world of nursing does not match their idealistic viewpoint. In the recovery phase, nurses begin to use humor, show a decrease in tension, and begin to view situations more objectively.

Q5: A nursing manager wants to plan a program to help decrease new graduates’ stress. Which activities should the nurse manager include in this program? (Select all that apply.) (Select all that apply.)

- A. Creating a master plan for increasing responsibilities of new staff (Correct)**
- B. Ensuring that new staff understand the unit’s formal chain of command
- C. Including formal skills practice and competency testing in a skills or scenario lab (Correct)**
- D. Providing an orientation to facility benefits and time-off policies

E. Reviewing proper communication techniques for calling primary health care providers

Rationale: Research shows that new graduates have several sources of stress in their jobs, including not feeling confident and competent, making mistakes because of increased responsibilities and workload, encountering new situations, surroundings, and procedures, inconsistent preceptors, getting to know the staff, encountering unhappy staff members, short-staffing, and working with staff members who are unwilling to help them. The nurse manager's plan should include activities to address these concerns. Although new staff needs to understand the chain of commands, addressing typical sources of stress for new graduates would not be a priority action. While understanding benefits and other human resources policies is important, this would not be a priority action to address typical sources of stress for new graduates. Learning communication techniques for calling primary health care providers is an important skill to master; however, this in itself would not be a priority action to address typical sources of stress for new graduates. The manager could include this in a more comprehensive program to address encountering new situations and procedures.
